

Your guide to changing your baby's nappy

Did you know that new babies can need a nappy change as many as 8 to 12 times per day? It is important that you're best prepared to change your baby's nappy.¹ Babies have delicate skin so it is important to change their nappy as soon as possible; doing this will help to prevent nappy rash.²

Before you get started, wash your hands, and ensure you have the following:³

- ✓ A changing mat or towel
- ✓ Wipes
- ✓ A nappy sac / bag to dispose of the dirty nappy
- ✓ Cream to suit your baby's skin
- ✓ A clean nappy

WaterWipes

Once you have the necessary materials, ensure that your nappy changing station is set up. The best place to change a nappy is on a changing mat or a towel on the floor; ensure that you always have visibility of your child.²

- 💧 If the nappy is dirty, use the nappy to clean off the stool from the baby's bottom
- 💧 Use wipes to remove excess stool and ensure your baby is completely clean (clean the nappy area gently and clean inside the folds of the skin) and pat the dry baby's bottom
- 💧 For a baby girl, wipe from front to back. For boys, wipe from back to front. Then dry their bottom thoroughly including the creases.
- 💧 If your baby is warm enough, let them lie on the changing mat without a nappy for a few minutes as airtime is good for babies' skin
- 💧 Dispose of the dirty nappy / wipes and wash your hands

If you have any concerns about your baby's skin or stool, please contact your doctor.

Understanding your baby's stool

Baby's stools vary depending on whether they are bottle or breast fed, and it's normal for your baby's stool to change from day to day.

💧 A baby's first stool will contain a sticky, tar-like substance which is dark green or black in color and called meconium.⁴

💧 Once the meconium passes, your baby's stool will turn a yellow, mustard color. After this, their subsequent stools are known as 'changing stools' and this is due to your baby's milk intake.⁴

If you have any questions about your baby's skin or stool, please contact your doctor.

WaterWipes

For parents, the below chart can help you monitor your child's stool.

Baby's first stool is dark green or black – meconium

Breastfed stool is mustard color, creamy consistency and seedy

Formula-fed stool is tan in color, similar texture to peanut butter

Normal stool. May be due to eating a lot of iron-fortified foods

Common stool for babies eating solids – mushy texture & brown / dark brown color

Call your doctor if you see the following colors:

Could be due to food or medications or could be blood

Black stool is seen in babies more than a few days old as it could be dried blood

White/grey or pale stool could be a sign of something serious
